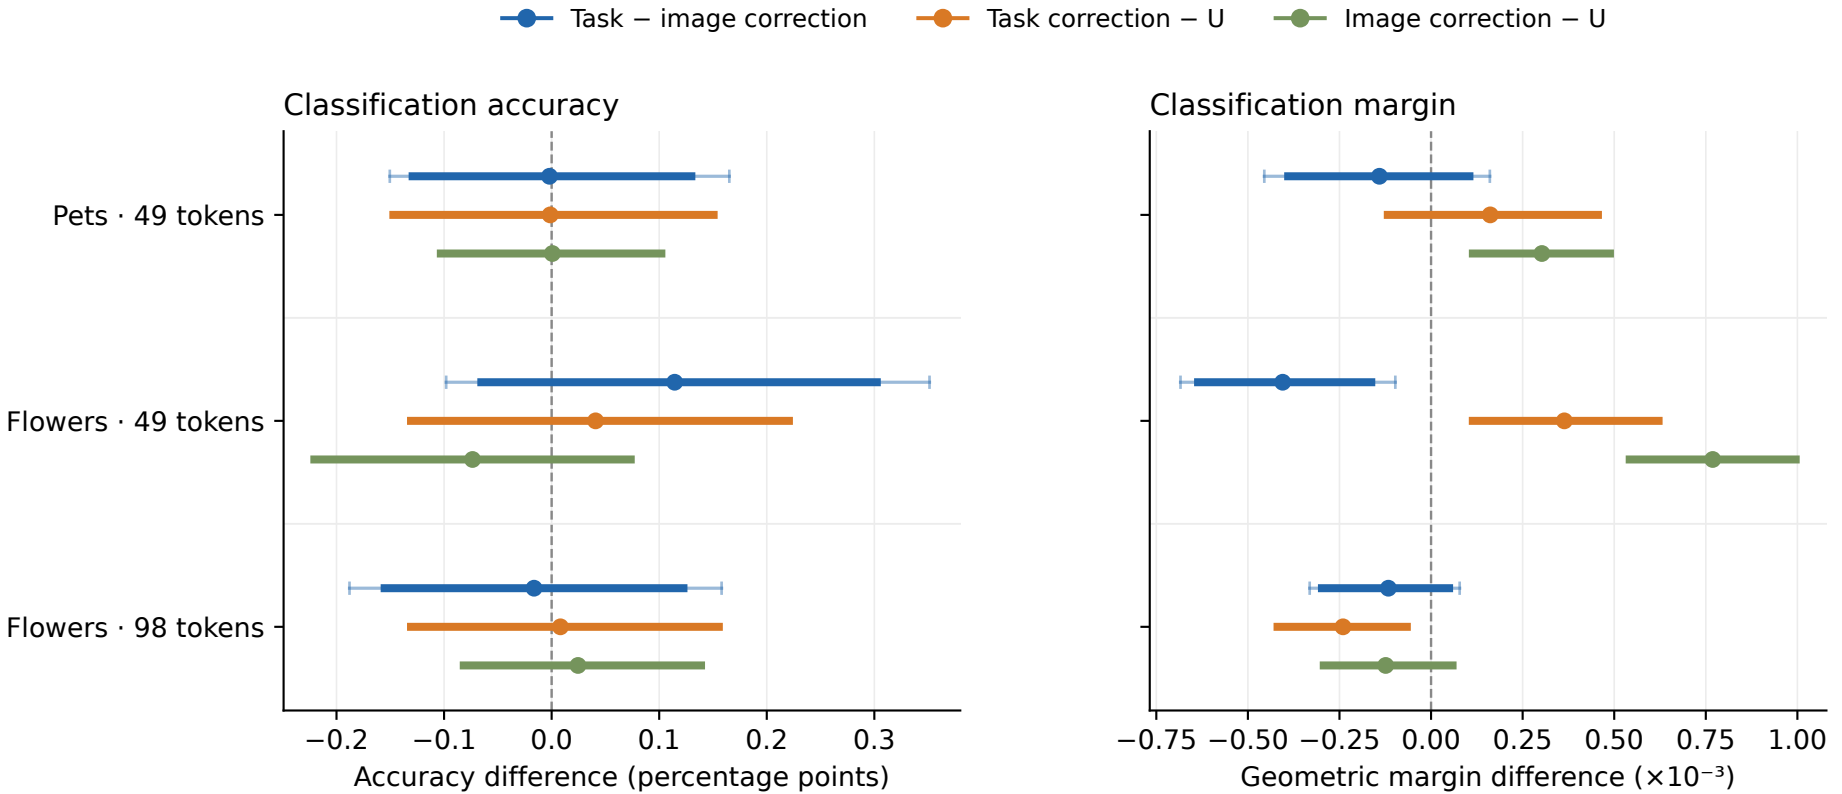
Learning a correction to a strong shared selector



Same frozen U; zero-output initialization; paired data, optimizer, and fixed training steps.
Task / image corrections use 9,801 / 9,850 learned parameters; totals are 357,200 / 357,249.
Points average all three training seeds. Thick intervals: paired image-bootstrap 95%.
Thin blue intervals: adjustment for the three primary task-minus-image comparisons, per metric.
